The present sequence is that of a degenerate sense PCR primer for human matrix metalloproteinase (MMP). Use with the antisense primer given in matrix metalloproteinase (MMP). Use with the antisense primer given in APQ81374 produces a PCR product of 400 bp. PCR was used to examine expressed in SW-1088, U-87MG and U-118 glioma cell lines. MMP-1 and MMP-3 were expressed in SW-1088, U-87MG and U-118 glioma cell lines and in SWN-SH neuroblastoma cells, while D54-MG glioma cells expressed low levels of MMP-373 MG or SMB-19, and 3 other neuroblastoma cell lines or SMB-19, and 3 other neuroblastoma cell lines. No MMP-10 mRNA expression was found in SW1088 and U-SMMG glioma cell lines. The invention provides a method of identifying a compound affecting the mitogen-activated protein kinase (MAPK) pathway. This involves contacting a test compound with a cell stably transfected with a recombinant construct comprising a reporter gene operatively with a recombinant construct comprising a change in the expression of the reporter gene. The cell constitutively expresses low levels of an invasion-associated gene (e.g. MMP), whereby stimulation of the invasion-associated gene occurs via activation of the MMPK pathway. Assay systems are provided to identify compounds that modulate expression of MMP-1 and MMP-3 in cancer cells. Such compounds are useful in cancer therapy
                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying a modulator of mitogen-activated protein kinase pathway, by contacting a cell transfected with recombinant construct encoding reporter gene, with a compound and detecting change in reporter gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mitogen activated protein kinase; MAPK; signal transduction; matrix metalloproteinase; MMP; enzyme; human; invasion-associated gene; cytostatic; glioma; cancer; therapy; assay; PCR; primer; ss.

The present sequence is that of a degenerate sense PCR primer for human matrix metalloproteinase (MMP). Use with the antisense primer given in ABQ813174 produces a PCR product of 400 bp. PCR was used to examine expression of MMPs in a panel of human brain tumour cell lines. MMP-1 and MMP-3 were expressed in SMV-3H neuroblastoma cells, while D54-MG glioma cells expressed low levels of MMP-3 with no MMP-1. expression. Neither MMP-1 nor MMP-1 was expressed in U-373 MG or SNB-19, and 3 other neuroblastoma cell lines and cexpressed in U-373 MG or SNB-19, and 3 other neuroblastoma cell lines or showed no MMP expression. MMP-10 expression was found in SW1088 and U-87MG glioma cell lines. No MMP-10 mRNM expression was found in neuroblastoma cell lines. The invention provides a method of identifying a compound affecting the mitogen-activated protein kinase (MAPK) pathway. This involves contacting a test compound with a cell stably transfected with a recombinant construct comprising a reporter gene operatively with a recombinant construct comprising a change in the expression of the reporter gene. The cell constitutively expresses low levels of an invasion-associated gene (cey MMP), whereby stimulation of the invasion-associated gene occurs via activation of the MAPK pathway. Assay systems are provided to identify compounds that modulate expression of MMP-3 in cancer therapy
                                                                                                                                                                                                                                                                                                                                                                                          Mitogen activated protein kinase; MAPK; signal transduction; matrix metalloproteinase; MMP; enzyme; human; invasion-associated gene; cytostatic; glioma; cancer; therapy; assay; PCR; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of identifying a compound for treating cancer. The method involves detecting the expression of a panel of sequences selected from transcription factor Ets-1, urokinase-type plasminogen activator (uPA), N-acetylglucosaminyltransferase V (GnT-V), matrix-type metalloproteinase (WMP)-1 and MMP-3 in the cell. The method cancer cell for identifying a compound that affects a cell. particularly a cancer cell or glioma cell, or cell that is involved in inflammation. It is used for diagnosing and/or treating cancer or other conditions that are affected by one or more members of a panel of genes or their protein product. The method is also useful for drug discovery, drug anafety evaluations and in gene therapy. The present sequence is reverse transcription PCR (RT-PCR) primer used to clone human MMP cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying a compound for treating cancer, comprises detecting transcription factor Ets-1, N-acetylglucosaminyltransferase V, urokinase-type plasminogen activator, matrix-type metalloproteinase-1 and -3 gene
                                                                                                                                                                                                                                 Human; cancer; urokinase-type plasminogen activator; uPA; inflammation; Bts-1 transcription factor; N-acerylglucosaminyltransferase V; GnT-V; matrix-type metalloproteinase; MMP-1; MMP-3; gene therapy; c-ets-1; reverse transcription PCR; RT-PCR primer; ss.

The sequence is that of the human papilloma virus (HPV) E6 consensus negative strand primer WD164 which was used in the amplification by PCR of HPV DNA. It may be used as part of a simple and rapid assay method for detecting and typing HPV in biological samples. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of identifying a compound for treating cancer. The method involves detecting the expression of a panel of sequences selected from transcription factor RE-1, urokinase-type plasminogen activator (uPA), Nacetylglucosaminyltransferase V (GnT-V), matrix-type metalloproteinase (MMP)-1 and MMP-3 in the cell. The method is useful for identifying a compound that affects a cell, particularly a cancer cell or glioma cell, or a cell that is involved in inflammation. It is used for diagnosing and/or treating cancer or other conditions that are affected by one or more members of a panel of genes or their protein product. The method is also useful for drug discovery, drug safety evaluations and in gene therapy. The present sequence is reverse transcription PCR (RT-PCR) primer used to clone human MMP cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô

                                      The sequence is that of the human papilloma virus (HPV) E6 consensus negative strand primer WD164 which was used in the amplification by PCR of HPV DNA. It may be used as part of a simple and rapid assay method for detecting and typing HPV in biological samples. (Updated on 25-MAR-2003 to correct PF field.)

It may be used as part of a simple and rapid assay method for detecting and typing HPV in biological samples. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                 The invention relates to new oligonucleotide probes and primers used for the detection of human papillomaviruses (HRV) which are not genital types 6, 11, 16, 18 or 33. The probes and primers AAT44608-T44693 are esp. used to detect HPV types 26, 31, 318, 35, 39, 40, 43, 45, 51-59 and 68. The primers can be used to detect these HPV types in conjunction with the consensus primers and typing probes AAT4473-T44906, which are based on and amplify fragments of the Li, BG, B7 and E1 regions of the HPV sequences. Detection of the amplification prods is done with probes derived from consensus sequences found in all characterised HPV setrand primers (AAT44813-6) to amplify short fragments of 225-250 bp from the E6 region of HPV types 6, 11, 16, 18 and 33. The amplified fragments are detected using the E6 consensus probes AAT4839-40, specific for these short fragments. (Updated on 25-MAR-2003 to correct PP field.)
                                                                                                                                                                                                               Nucleic acid hybridisation probes - specific for selected human papilloma
virus types.

The invention relates to new oligonucleotide probes and primers used for the detection of human papillomaviruses (HPV) which are not genital types 6, 11, 16, 18 or 31. The probes and primers AAT44693 are esp. used to detect HPV types 26, 31, 39, 40, 43, 45, 51-59 and 68. The primers can be used to detect these HPV types in conjunction with the consensus primers and typing probes AAT44733-T44906, which are based on and amplify fragments of the LI, E6, E7 and E1 regions of the HPV sequences. Detection of the amplification prods is done with probes derived from consensus sequences found in all characterised HPV sequences. The negative strand primers AAT44821-6 are used with positive strand primers farm of the amplification prods of 225-250 bp from the E6 region of HPV types 6, 11, 16, 18 and 33. The amplified fragments are detected using the E6 consensus probes AAT44839-40, specific for
                                                                                                                                                                            Nucleic acid hybridisation probes – specific for selected human papilloma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                                                                        ઠે
                                                                                                                                  The invention relates to new oligonucleotide probes and primers used for the detection of human papillomaviruses (HPV) which are not genital types (5, 11, 16, 18 or 33. The probes and primers AR744608-T44693 are esp. used to detect HPV types 26, 31, 318, 35, 39, 40, 43, 45, 51.59 and 68. The primers and typing probes AR74474808. The conjunction with the consensus primers and typing probes AR74474374906, which are based on and amplify fragments of the Li, E6, E7 and E1 regions of the HPV sequences. Detection of the amplification prods. is done with probes derived from consensus sequences found in all characterised HPV sequences. The negative strand primers AR744821-6 are used with positive strand primers (AA744813-6) to amplify short fragments of 225-250 bp from the E6 region of HPV types 6, 11, 16, 18 and 33. The amplified fragments are detected using the E6 consensus probes AA744839-40, specific for these short fragments. (Updated on 25-MAR-2003 to correct PF field.)

The invention relates to new oligonucleotide probes and primers used for the invention of human papillomaviruses (HPV) which are not genital types 5, 11, 16, 18 or 33. The probes and primers AAT44608-T44693 are esp. used to detect HPV types 26, 31, 318, 35, 39, 40, 43, 45, 51-59 and 68. The primers can be used to detect these HPV types in conjunction with the consensus primers and typing probes AAT44733-T44906, which are based on amplify fragments of the Li, E6, B7 and E1 regions of the HPV sequences. Detection of the amplification prodes is done with probes sequences. Detection of the amplification prodes is done with probes sequences. The negative strand primers AAT44821-6 are used with positive the E6 region of HPV types 6, 11, 16, 18 and 33. The amplified fragments are detected using the E6 consensus probes AAT44839-40, specific for these short fragments. (Updated on 25-MAR-2003 to correct PF field.)

This sequence represents a p53 DNA binding site consensus sequence which is used in an example of a novel method for determining the tumour suppressor status of a tumour. The method involves administering, to the tumour, a novel construct comprising a nucleic acid molecule encoding a reporter molecule and a nucleic acid molecule capable of binding the tumour suppressor, so that binding causes the reporter molecule to be expressed, and determining if the reporter molecule is produced in the tumour. In this example the tumour suppressor is p53, and the method can be used to identify tumours particularly of the head and neck, suitable for radiation therapy. This method is rapid and can be performed in vivo, eliminating the need for biopsy samples or cell lysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a p53 DNA binding site consensus sequence which is used in an example of a novel method for determining the tumour suppressor status of a tumour. The method involves administering, to the tumour, a novel construct comprising a nucleic acid molecule encoding a reporter molecule and a nucleic acid molecule of binding the tumour suppressor, so that binding causes the reporter molecule to be tumour. In this example the tumour suppressor is produced in the tumour. In this example the tumour suppressor is p53, and the method can be used to identify tumours, particularly of the head and neck, suitable for radiation therapy. This method is rapid and can be performed in vivo,

                                                                                                                                                                                                                                                                                                                                             This invention describes a novel detecting apparatus for identifying the subtypes of human papillomaviruses (HPV) contained in a sample which comprises a carrier which can load sample, a first oligonuclectide loaded on first part of the carrier and a second oligonuclectide loaded on second part of carrier, in which first and second oligonuclectide on the second part of the first and the second HPV subtype and can identify HPV subtype contained in sample at the same time. This sequence represents a PCR primer used in the method of the invention.
                                                                                                                                                                                                                                                                                           A detecting apparatus and a detecting method for identifying the subtypes of many species of human papilloma viruses at the same time and a composition for the detection.

This invention describes a novel detecting apparatus for identifying the subtypes of human papillomaviruses (HPV) contained in a sample which comprises a carrier which can load sample, a first oligonucleotide loaded on first part of the carrier and a second oligonucleotide loaded on second part of carrier, in which first and second oligonucleotides of the part of the first and second oligonucleotides in which first and second oligonucleotides in the DNA of the first and second HPV subtype and can identify HPV subtype contained in sample at the same time. This sequence represents a PCR primer used in the method of the invention.
                                                                                                                                                                                                                                                        A detecting apparatus and a detecting method for identifying the subtypes of many species of human papilloma viruses at the same time and a composition for the detection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

This invention relates to a method for detecting multiple viral agents in a sample. The method consists of amplifying nucleic acids from Human immunodeficiency virus (HIV), Hepatitis C virus (HCV), and or Hepatitis B virus (HBV) using a mixture of primers specific for HBV, HCV HIV-1 type M and HIV-1 type O and detecting their presence. Included in the invention is a kit for the detection of HIV, HCV, HBV and combinations of them in a blood or blood product sample. The method can be used to test blood donated for transfusions for the presence of infection with HIV, HBV or HCV. The present sequence represents a probe specific for the gp41 region of HIV, which can be used in the method of the invention. (Updated on 11-

virus (HBV) using a mixture of primers specific for HBV, HCV HIV-1 type M and HIV-1 type O and detecting their presence. Included in the invention is a kit for the detection of HIV, HCV, HBV and combinations of them in a blood or blood product sample. The method can be used to test blood donated for transfusions for the presence of infection with HIV, HBV or HCV. The present sequence represents a probe specific for the gp41 region of HIV, which can be used in the method of the invention. (Updated on 11-

ö
where the protein is expressed in the mammal, organ, tissue or cells, defined regions of the DNA appearing as ADA50036 which encodes the pig CTLA4 (cytocoxic T lymphocyte A4, also known as CD152) and defined regions of the CTLA4 protein ADA50037. The chimaeric protein is useful in the protection of the porcine cell after xenotransplantation into a human, and in inhibiting humoral and cellular defence mechanism. Chimaeras were produced comprising pig CTLA4 (cellular immune response region) and human CD59 (humoral response region), and of CTLA4 and human DAF (not defined). The present sequence is a degenerate PCR primer used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a chimaeric protein comprising a first domain capable of inhibiting a cellular immune response and a second domain capable of inhibiting a humoral immune response. Also included are a chimaeric DNA construct (comprising a DNA sequence encoding a domain capable of inhibiting a cellular immune response and a DNA sequence encoding a domain capable of inhibiting a humoral immune response), a cloning vector comprising the DNA construct, a host cell transformed by the vector, a transgenic cell, tissue, orsan or mammal comprising the chimaeric protein, producing a mammal, mammalian organ, tissue or cells, where the mammal is useful as an organ donor for a human or organ, tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunosuppressive, cellular immune response, humoral immune response, cytotoxic T lymphocyte A4; CD152; CTLA4; CD59; xenotransplantation; transplant rejection; 88; PCR; human; primer; rabbit; cow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pig cDNA encoding cytotoxic T lymphocyte A4 degenerate PCR primer #1.
                                                                                                                                                                                                                                                                                              Gaps

or cells transplant into a human, by inserting a nucleic acid encoding a chimaeric protein defined above into the mammal, organ, tissue or cells, where the protein is expressed in the mammal, organ, tissue or cells, defined regions of the DNA appearing as ADA50036 which encodes the pig CTLA4 (cytotoxic T lymphocyte A4, also known as CD152) and defined the protection of the procien ADA50037. The chimaeric procein is useful in the protection of the porcine cell after xenotransplantation into a human, and in inhibiting humoral and cellular defence mechanism. Thimaers were produced comprising pig CTLA4 (cellular immune response region) and human CD59 (humoral response region), and of CTLA4 and human DAF (not defined). The present sequence is a degenerate PCR primer used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents an oligonucleotide which can be used for the detection of a TRH-producing microbe (where TRH is a TDH-related haemolysin, and TDH is a thermostable direct haemolysin). The oligonucleotide is useful for detection of Vibrio parahaemolyticus. The oligonucleotide provides highly specific detection

This sequence is the pUC sequencing primer, which is being claimed as an arbitrary PCR primer" for use in an arbitrarily primed PCR reaction (APPER) arbitrary PCR primer at low stringency conditions forms primed nucleic acids with a substantial degree of mismatching having occured between primer and target. Several rounds of PCR are then primed an anageable number of individual bands providing a resolved into a manageable number of individual bands providing a resolved into a manageable number of singerprint of the cemplate DNA. Used against genomic DNA from microorganisms, this method will generate a fingerprint of the organism occoncerned, thus giving a rapid and simple method of identification and classification. Only a small amount of biological material is required, and prior knowledge of the nucleotide sequence, molecular biology, or biochemistry of the organism is not necessary. Only one primer is required for amplification/identification. The method may also be used to generate detectable polymorphisms for generate mapping of animals and humans. See also AAQ24770-7 (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                       Arbitrarily primed polymerase chain reaction method - allows distinction of bacterial, mammalian and plant species due to individual specific fingerprints produced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   abitrarily primed polymerase chain reaction; fingerprint; identification; restriction fragment length polymorphisms; RFLP; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents an oligonucleotide which can be used for the detection of a TRH-producing microbe (where TRH is a TDH-related haemolysin, and TDH is a thermostable direct haemolysin). The oligonucleotide is useful for detection of Vibrio parahaemolyticus. The oligonucleotide provides highly specific detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence is the pUC sequencing primer, which is being claimed as an arbitrary PCR primer" for use in an arbitrarily primed PCR reaction (APPR). The use of a single primer at low stringency conditions forms primed nucleic acids with a substantial degree of mismatching having occured between primer and target. Several rounds of PCR are then performed, reproducibly generating specific discrete products that can be resolved into a manageable number of individual bands providing a fingerprint of the template DNA. Used against genomic DNA from microorganisms, this method will generate a fingerprint of the organism of classification. Only a small amount of biological material is required, and prior knowledge of the nucleotide sequence, molecular biology, or biochemistry of the organism is not necessary. Only one primer is biochemistry of the organism is not necessary. Only one primer is crequired for amplification/identification. The method may also be used to generate detectable polymorphisms for generate mapping of animals and humans. See also AAQ24770-7 (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Primer; arbitrarily primed polymerase chain reaction; AP-PCR; amplification; identification; classification; bacteria; mammal; plant; polymorphism; genetic mapping; eukaryote; ss.

```
the generation of a set of discrete DNA sequences characteristic of a genome. The method comprises forming a PCR admixt. by combining in a PCR genome. The method comprises forming a PCR admixt. by combining in a PCR buffer, genomic DNA and at least one primer 10-50 bases in length and then subjecting the admixt. to at least one PCR thermocycle. The hybridisation step permits the arbitrary priming of the genomic DNA, thereby producing a set of discrete DNA segments. The amplification primer except that the second primer, which matches the first primer except that the second primer has one or more additional bases at the 3' terminus, to form a second admixt. This second admixt. is then subjected to PCR thermocycles in which the hybridisation does not permit formation of primer-template dupless with a substantial degree of mismatch, thereby amplifying a discrete subset of DNA segments. The such as bacteria, mammals and plants, and for the generation of organisms such as bacteria, mammals and plants, and for the generation of corpanisms polymorphisms suitable for genetic mapping of eukaryotes. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAT16358-64 are primers which were used to demonstrate the method of the invention. The method of the invention is termed "arbitrarily primed polymerase chain reaction" (AP-PCR) and causes the generation of a set of discrete DNA sequences characteristic of a genome. The method comprises forming a PCR admixt. by combining in a PCR buffer, genomic DNA and at least one primer 10-50 bases in length and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Primer; arbitrarily primed polymerase chain reaction; AP-PCR; amplification; identification; classification; bacteria; mammal; plant; polymorphism; genetic mapping; eukaryote; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

ö
then subjecting the admixt. to at least one PCR thermocycle. The hybridisation step permits the arbitrary priming of the genomic DNA, thereby producing a set of discrete DNA segments. The amplification products are then contacted with a second primer, which matches the first primer except that the second primer has one or more additional bases at the 3' terminus, to form a second admixt. This second admixt. is then subjected to PCR thermocycles in which the hybridisation does not permit formation of primer-template duplexes with a substantial degree of mismatch, thereby amplifying a discrete subset of DNA segments. The method may be used for the identification and classification of organisms such as bacteria, mammals and plants, and for the generation of polymorphisms suitable for genetic mapping of eukaryotes. (Updated on 25-MAR-2003 to correct PP field.)
                                                                                                                                                                                                                                                                                    Gaps

cc samples compared to normal. The method also determines the effects of factors like growth factors, cytokines, or hormones and drugs on the gene expression and is also used in drug screening. The method can be utilised for understranding many processes in normal cell biology, development and concogenesis. Many unidentified gene family members and the full length concogenesis. Many unidentified gene family members and characterised. It also provides means of identifying predictive marker genes for a given condition. The method utilises smaller amounts of starting material than conn-PCR based technologies and it does not require the cloning and sequencing of amplified products, thereby immediate, unambiguous signals connected by known genes and unknown genes is identified. It is sensitive (expression levels of genes transcripts which is lout of 2 million can be identified). It is not labour-intensive, time-consuming and analyzes concessing of larger number of samples simultaneously is achieved and the processing of larger number of samples atmultaneously is achieved and the expression levels of thousands of genes in hundreds of samples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a PCR primer for restriction analysis of gene expression (RACE) for human tyrosine kinase coding sequence. The invention relates to a method for the amplification of a sample using two primers which are at least partially complementary to two conserved primers which are at defined maximum and minimum distence in each gene of a multigene family and isolation of the product of desired size range. The method is used for analysing expressed genes in biological samples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Restriction analysis of gene expression for characterizing expression in different samples, identifying resistance markers, etc.,.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PCR primer; tyrosine kinase; RAGE; human; gene expression analysis; restriction analysis of gene expression; cancer; tumour tissue; drug screening; cell biology; development; oncogenesis; gene family member identification; marker gene identification; ss.

This sequence represents a PCR primer for restriction analysis of gene expression (RAGB) for human tyrosine kinase coding sequence. The invention relates to a method for the amplification of a sample using two primers which are at least partially complementary to two conserved regions, separated by a defined maximum and minimum distance in each gene of a multigene family and isolation of the product of dealred size range. The method is used for analysing expressed genes in biological samples respecially two mRNA containing samples and thus different samples compared (e.g. cancer and non-cancer samples) to identify differentially expressed genes. RAGE on tyrosine kinase family in normal and tumour tissue blocks showed elevated kinase (NYK and CSK) expression in tumour

Restriction analysis of gene expression for characterizing expression in different samples, identifying resistance markers, etc.,.

especially two mRNA containing samples and thus different samples can be compared (e.g. cancer and non-cancer samples) to identify differentially expressed genes. RAGE on tyrosine kinase family in normal and tumour tissue blocks showed elevated kinase (NYK and CSK) expression in tumour samples compared to normal. The method also determines the effects of factors like growth factors, cytokines, or hormones and drugs on the gene expression and is also used in drug screening. The method can be utilised corresponding many processes in normal cell biology, development and oncogenesis. Many unidentified gene family members and the full length gene corresponding to the sample can be identified and characterised. It also provides means of identifying predictive marker genes for a given condition. The method utilises smaller amounts of starting material than non-PCR based technologies and it does not require the cloning and non-PCR based technologies and it does not require the cloning and sequencing of amplified products, thereby immediate, unambiguous signals produced by known genes and unknown genes is identified. It is sensitive (expression levels of genes transcripts which is 1 out of 2 million can be identified). It is not labour-intensive, time-consuming and analyzes specific gene families rather than all expressed genes. Parallel processing of larger number of samples simultaneously is achieved and the method can be utilised on multiple automated devices which measures the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      expression levels of thousands of genes in hundreds of samples

New isolated transforming growth factor-betal repressed transcript 1 polynucleotide useful for distinguishing growth-arrested cells from non-growth-arrested cells, and for producing antibodies.

Disclosure; Col 4; 48pp; English.

The present sequence for degenerate pUC sequencing primer is used in AP-PCR (arbitrarily primed PCR). Various arbitrary primers (AASO4145-

method for generating discrete DNA PCR products (characteristic of a genome) as a "fingerprint". The AP-PCR method comprises priming the target nucleic acid from a genome or cellular RNA preparation with a single-stranded primer to form a primed nucleic acid with a substantial degree of mismatch between the primer and target sequence. The primed eggree of mismatch between the primer and target sequence. The primed sequence is amplified by at least 1 cycle of PCR and the resulting product amplified by a second step of PCR of at least 10 cycles. AP-PCR is useful for the rapid identification of bacterial species and strains, mammals and plants. AP-PCR is useful as it does not require knowledge of the nucleotide sequence of the organism to be identified. Transforming growth factor (TGP)-betal repressed transcript 1 (TRT1) polynucleotide (AAS04153) which is associated with arrested cell growth is also described. TRT1 is useful for the production of anti-sense RNA capable of hybridising to the TRT1 polynucleotide, for producing antibodies, and for distinguishing growth-arrested cells from non-growth-arrested cells. The sequence for LPP9.5m (AAU02482) which is associated with normal growth of ö New isolated transforming growth factor-betal repressed transcript 1 polynucleotide useful for distinguishing growth-arrested cells from nongrowth-arrested cells, and for producing antibodies. The present sequence for degenerate pUC sequencing primer is used in AP-PCR (arbitrarily primed PCR). Generating discrete set of DNA segments characteristic of sample of single-stranded RNA, useful for identification and classification of organisms, comprises carrying out arbitrarily primed polymerase chain reaction

Disclosure; SEQ ID NO 8; 31pp; English.

The invention relates to a method of generating a discrete set of DNA characteristic of a single-stranded RNA sample. The method is useful for generating a discrete set of DNA segments characteristic of a sample of single-stranded RNA. The method is useful for identification and classification of organisms, for the generation of polymorphisms suitable for genetic mapping of eukaryotes, for the identification of tissue and

a cell or tissue. The method is used to verify the assignment of a bacteria to a species. The method is useful in the generation of linkage maps and can be correlated with restriction fragment length polymorphisms (RFLPB) and other markers. The method is useful for generating detectable polymorphisms, for use in genetic mapping of animals and humans. The method is useful for the identification of tissue as in tissues the identification of tissue as in tissue typing and the identification of tissue as in tissue typing and cell or tissue, e.g. particular genes respond to a particular agent or treatment. The method will indicate a respond to the treatment at the treatment. The method will indicate a response to the treatment at the level of differential gene expression. The method can identify species, cell types or tissues rapidly. The method is capable of initiating amplification in the presence of a substantial degree of mismatching method requires only one primer sequence for amplification. The present

for genetic mapping of enkaryotes, for the identification of tissue and cell types, and for monitoring changes in the state of gene expression of cell types, and for monitoring changes in the state of gene expression of a cell types, and for monitoring changes in the state of gene expression of the content of a species. The method is useful in the generation of linkage and can be correlated with restriction fragment length polymorphisms of kRFMPS) and other markers. The method is useful for generating detectable polymorphisms, for use in genetic mapping of animals and humans. The method is useful for the identification of tissue as in tissue typing and the identification of strain polymorphism and to detect changes in the cell or tissue, e.g. particular genes respond to a particular agent or treatment. The method will indicate a response to the treatment at the level of differential gene expression. The method can identify apportes, cell types or tissues rapidly. The method is capable of initiating amplification in the presence of a substantial degree of mismatching. The method requires requence for amplification. The present

sequence represents a pUC sequencing primer

classification of organisms, for the generation of polymorphisms suitable

cell types, and for monitoring changes in the state of gene expression of cell types, and for monitoring changes in the state of gene expression of a cell types, and for monitoring changes in the state of gene expression of a cell or tissue. The method is used to varify the assignment of linkage maps and can be correlated with restriction fragment length polymorphisms (RPLPS) and other markers. The method is useful for generating detectable polymorphisms, for use in genetic mapping of animals and humans. The method is useful for the identic mapping of animals and humans. The method is useful for the identification of tissue as in tissue typing and the identification of strain polymorphism and to detect changes in the cell or tissue, e.g. particular gene response to the treatment at the treatment. The method will indicate a response to the treatment at the cell types or tissues rapidly. The method is capable of initiating amplification in the presence of a substantial degree of mismatching. The method requires only one primer sequence for amplification. The present

classification of organisms, for the generation of polymorphisms suitable carely for genetic mapping of eukaryotes, for the identification of tissue and call by the monitoring changes in the state of gene expression of a cell types, and for monitoring changes in the state of gene expression of a cell or tissue. The method is used to verify the assignment of a cell or tissue. The method is useful in the generation of linkage mapping and can be correlated with restriction fragment length polymorphisms (RFLPs) and other markers. The method is useful for generating detectable polymorphisms, for use in genetic mapping of animals and humans. The method is useful for the identification of tissue as in tissue typing and the identification of strain polymorphism and to detect changes in the call or tissue, e.g. particular genes respond to a particular agent or treatment. The method will indicate a response to the treatment at the level of differential gene expression. The method can identify species, call types or tissues rapidaly. The method is capable of initiating amplification in the presence of a substantial degree of mismatching. The method requires only one primer sequence for amplification. The present
      useful for identification and
single-stranded RNA. The method is

ö
                  transcribable polymucleotides having sequences of nucleotides encoding RNA elements which modulates the stability of a transcript corresponding to the transcribable polymucleotide. The expression vectors are useful for modulating the stability of a transcript and determining expression of a polymucleotide of interest. They are useful for modulating gene expression, identifying and analysing regulatory sequences, new targets and reagents for treating human diseases and for drug screening. The present sequence is histone 3' untranslated region (UTR) DNA fragment. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel expression vectors and/or reporter vectors providing kinetics of protein expression with improved temporal correlation to the premoter activity. The expression vectors comprise transcribable polymucleotides having sequences of nucleotides encoding RNA elements which modulates the stability of a transcript corresponding to the transcribable polymucleotide. The expression vectors are useful for modulating the stability of a transcript and determining expression of a polymucleotide of interest. They are useful for modulating gene expression, identifying and analysing regulatory sequences, new targets and reagents for treating human diseases and for drug screening. The present sequence is histone 3' untranslated region (UTR) DNA fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New expression vector useful for modulating gene expression, identifying and analyzing regulatory sequences, new targets and reagents for treating human diseases, comprises a transcribable polynucleotide encoding an RNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel expression vectors and/or reporter vectors providing kinetics of protein expression with improved temporal correlation to the promoter activity. The expression vectors comprise transcribable polymucleotides having sequences of nucleotides encoding RNA elements which modulates the stability of a transcript corresponding for modulating the stability of a transcript and determining expression of a polymucleotide of interest. They are useful for modulating gene expression, identifying and analysing regulatory sequences, new targets and reagents for treating human diseases and for drug screening. The present sequence is histone 3' untranslated region (UTR) DNA fragment. This sequence is used in the exemplification of the invention

The expression vectors comprise transcribable polymucleotides having sequences of nucleotides encoding RNA elements which modulates the stability of a transcript corresponding for modulating the stability of a transcript corresponding for modulating the stability of a transcript and determining expression of a polymucleotide of interest. They are useful for modulating gene expression, identifying and analysing regulatory sequences, new targets and reagents for treating human diseases and for drug screening. The present sequence is histone 3' untranslated region (UTR) DNA fragment. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New expression vector useful for modulating gene expression, identifying and analyzing regulatory sequences, new targets and reagents for treating human diseases, comprises a transcribable polynucleotide encoding an RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

New peptide EPPT (Glu-Pro-Pro-Thr) - selectively binds mucin expressed by epithelial tumours, used for guiding toxins or labels to tumours expressing mucin.
                                                                                                                                                                                                                                                                                                                                             Clone B is a lymphoblastoid cell line (secreting antibody directed against a tumour-associated mucin mol.) derived from the EBV- transfoming and cloning of a patient's peripheral blood B-cells. After DNA isolation, the polymerase chain reaction (FCR) was employed, using oligonucleotide primers specific for the variable light and heavy chains of immunoglobuling (see AAQ30065, AAQ30066). (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mass spectrometry, diagnosis, detection, biological sample, infection, genetic disease; chromosomal abnormality; identification, heredity, pathogenic organism; telomerase activity; oncogene mutation; cancer-specific sequence; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Clone B is a lymphoblastoid cell line (secreting antibody directed against a tumour-associated mucin mol.) derived from the EBV- transfoming and cloning of a patient's peripheral blood B-cells. After DNA isolation, the polymerase chain reaction (FOR) was employed, using oligonucleotide primers specific for the variable light and heavy chains of immunoglobulins (see AAQ30065, AAQ30066).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A process has been developed for determining the sequence of a target nucleic acid. The process comprises: (i) generating at least two fragments (P) from the target nucleic acid; and (ii) analysing F by mass spectrometrs (WS). The sequences in AAV39483 to AAV39592 are specifically claimed primers for use in the mass spectrometric analysis of the above process. The process is used to detect genetic diseases (e.g. claemophilia, thalassemia, Duchenne muscular dystrophy, Alzheimer's disease, cystic fibrosis and many others) or chromosomal abnormalities (or predisposition); infections and cancers; also for establishing identity and heredity. Particular applications are disagnosis of neuroblastoma, detecting telomerase, determining family relationships and methods using MS, this process requires fewer specific reagents and is chetter suited to automation. Extended primers are shorter; primer chetter suited to automation. Extended primers are shorter; primer annealing is more efficient and the process allows detection of many sequences simultaneously. The present sequence represent an oligonucleotide from the present sequence represent an oligonucleotide from the present signed; within the sequence listing

A process has been developed for determining the sequence of a target nucleic acid. The process comprises: (i) generating at least two fragments (F) from the target nucleic acid; and (ii) hanlysing F by mass spectrometry (MS). The sequences in AAV33483 to AAV3552 are specifically claimed primers for use in the mass spectrometric analysis of the above process. The process is used to detect genetic diseases (e.g. disease, Tyestic fibrosis and many others) or chromosomal abnormalities disease, cystic fibrosis and many others) or chromosomal abnormalities (or predisposition); infections and cancers; also for establishing identity and heredity. Particular applications are disgnosis of charbolastoma, detecting telomerase, determining family relationships and cancerblastoma, detecting telomerase, determining family relationships and methods using MS, this process requires fewer specific reagents and is chetter suited to automation. Extended primers are shorter; primer annealing is more efficient and the process allows detection of many sequences simultaneously. The present sequence represent an oligonucleotide from the present in, which is not actually specified within the specification, only within the sequence listing
                                                                                                                                                                                                                                                                                                  Sequencing nucleic acid by mass spectrometric analysis - for detecting nucleic acids, telomerase activity, oncogene mutations, or cancerspecific sequences, for diagnosis of disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

A chemically synthesized promoter can comprise a conserved domain IIb as shown here for high level expression of genes. Chemically synthesized artificial promoters are new and comprise a DNA sequence designed for a trificial promoters are new and comprise a DNA sequence designed for a targeted level and pattern of gene expression by strategically putting together several signature sequences identified by sequence alignment and statistical analysis of a large database constructed for this purpose. A method for chemically synthesizing an artificial promoter for expressing genes at a desired level in different organisms is also claimed. The high level expression in a plant using such an artificial promoter (e.g. AA28449) can be measured comprising polyethylene glycol (PEG) mediated transformation of plant tissues including root, stem, intact leaf tissue followed by transient GUS assay to compare with a natural CaMW 35s promoter showing the desired level of activity. The promoter is useful for high level expression of transgenes in different organisms and for even the most compare and is efficient and can be synthesized to express in even the most compare in the desired servers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Artificial promoter; strong; weak; transgene expression; plant; ss.
               New chemically synthesized artificial promoter, useful high level expression of transgenes in different organisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0; Indels

A chemically synthesized promoter can comprise a conserved domain IIb as shown here for high level expression of genes. Chemically synthesized artificial promoters are new and comprise a DNA sequence designed for a targeted level and pattern of gene expression by strategically putting

New chemically synthesized artificial promoter, useful high level expression of transgenes in different organisms.

WPI; 2000-341712/30.

together several signature sequences identified by sequence alignment and statistical analysis of a large database constructed for this purpose. A method for chemically synthesizing an artificial promoter for expressing genes at a desired level in different organisms is also claimed. The high level expression in a plant using such an artificial promoter (e.g. hAA28449) can be measured comprising polyethylene glycol (PEG) mediated transformation of plant protoplasts as well as biolistic mediated transformation of plant tissues including root, stem, intact leaf tissue followed by transient GUS assay to compare with a natural CaMV 35s for moder showing the desired level of activity. The promoter is useful for high level expression of transgenes in different organisms and for testing high level gene expression in plants (claimed). The promoter is bloogically active and is efficient and can be synthesized to express in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a lipid-methylated nucleic acid formulation for stimulating an immune response in an animal, comprising a lipid component and a nucleic acid component which is a methylated nucleic acid sequence. Also described: (1) an adjuvant comprising a lipid-nucleic acid (LNA) formulation; (2) a vaccine comprising the LNA formulation in combination with at least one target antigen; (3) stimulating an enhanced host immune response to antigenic stimulation,
                                                                                                                                                                                                                                                                                                                                                                                        Gaps

comprising administering to the host the LNA formulation; (4) stimulating host dendritic cells in vivo, comprising contacting at least one dendritic cells in vivo, comprising contacting at least one dendritic cells in vivo, comprising contacting at least one contaction to an obst; and (5) simultaneously delivering antigenic and adjuvant immune stimulation to antigen presenting cells, comprising the administration of the LNA formulation associated with a target antigen. The liptid-methylation nucleic acid formulation has immunostimulant, cytostatic, antiinflammatory and antiarthritic activities, and can be used in vaccines, and in gene therapy. The formulation and methods are useful in activating and/or expanding dendritic cell populations in response to antigenic stimulation. They may be used for treating cancer, antigenic stimulation. They may be used for treating cancer, inflammation, arthritis or immunodeficiency disorders. The present sequence represents a methylated immunostimulatory oligonucleotide given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a lipid-methylated nucleic acid formulation for stimulating an immune response in an animal, comprising a lipid component and a nucleic acid component which is a methylated nucleic acid sequence. Also described: (1) an adjuvant comprising a lipid -nucleic acid (LNA) formulation; (2) a vaccine comprising the LNA formulation in combination with at least one target antigen; (3)
                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

comprising an enhanced host immune response to antigenic stimulation, comprising administering to the host the LNA formulation; (4) stimulating host dendritic cells in vivo, comprising contacting at least one contribution to all the lipid-methylated mucleic acid formulation to a thost; and (5) simultaneously delivering antigenic and adjuvant immune the LNA formulation associated with a target antigen. The lipid-methylation nucleic acid formulation has immunostimulant, cytostatic, antinfinammatory and antiarthritic activities, and can be used in stimulating a host's immune response to antigenic stimulation. They may be used for activating and/or expanding dendritic cell populations in response to antigenic stimulation. They may be used for treating and/or expanding dendritic cell populations in response to antigenic stimulation. They may be used for treating cancer.

Inflammation, arthritis or immunodeficiency disorders. The present sequence represents a methylated immunostimulatory oligonucleotide given

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel cosmetic or pharmaceutical composition for treatment of epithelial tissue comprising nucleic acids with nonmethylated CpG units. The invention also describes a fabric softener, hand washing product, body or hair care product, hair dye or manual dishwashing product comprising nucleic acids with nonmethylated CpG units. The nucleic acids are 6-10 nucleotides in length and include the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cosmetic; pharmaceutical; epithelial tissue; fabric softener; hand washing product; body care product; hair care product; hair dye; manual dishwashing product; nonmethylated CpG; antinflammatory; dermatological; antipsoriatic; endocrine; vulnerary; immunosuppressive; interleukin-6 release inhibitor; interleukin-8 release inhibitor; epithelial inflammation; inflammation-induced aging; psoriasis; atopic eczema; dry skin; alopecia arreata; vitiligo; bullous disease; graft versus host; UV-induced skin inflammation; parodontosis; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cosmetic or pharmaceutical composition for treatment of epithelial tissue, especially to combat inflammation, comprises nucleic acids with nonmethylated CpG units.

phosphonate,

replacing phosphodiester linkages with methyl

are optionally modified

```
by replacing phosphodisty. The much actual are upturnally monified phosphoramidate, phosphoramidate of the converse of the investives of the replacing sugar phosphate units bridged 2'-deoxyribose derivatives or by replacing sugar phosphate units aminoethylylylycine. The nucleic acids are packed into lipsommes. The products of the invention have antiinflammatory, dermatological, antipportatic, general endocrine, vulnerary and immunosuppressive antipportatic, general endocrine, vulnerary and immunosuppressive activity and act as interleukin-6 or interleukin-8 release inhibitors. The composition is especially useful for preventing or treating epithelial inflammations, including inflammation-induced aging, diseases, graft versus host reactions, UV-induced skin inflammation and parodontosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cosmetic or pharmaceutical composition for treatment of epithelial tissue, especially to combat inflammation, comprises nucleic acids with nonmethylated CpG units.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              25-JUL-2002; 2002DE-01033994.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (PHEN-) PHENION GMBH & CO KG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2004-192562/19.
```

This invention describes a novel cosmetic or pharmaceutical composition for treatment of epithelial tissue comprising nucleic acids with nonmethylated CpG units. The invention also describes a fabric softener, hand washing product, body or hair care product, hair dye or manual dishwashing product comprising nucleic acids with nonmethylated CpG units. The nucleic acids are 6-10 nucleotides in length and include the sequence 5'-A/GA/GCGC/TC/T-3'. The nucleic acids are optionally modified

```
phosphoramidate, phosphorothioste or hydroxylamine linkages, by replacing ribose with other hexo- or pentopyranoses with 3',5'-carbocyclically bridged 2'-deoxyribose derivatives or by replacing sugar phosphate units with carboxamide units based on amino acid derivatives, e.g. N-(2-aminoethyl)glycine. The nucleic acids are packed into liposomes. The products of the invention have antiinflammatory, dermatological, antipportatic, general endocrine, vulnerary and immunosuppressive activity and act as interleukin-6 or interleukin-8 release inhibitors. The composition is especially useful for preventing or treating perihelial inflammations including inflammation-induced aging, psoriasis, atopic eczema, dry skin, alopecia arreata, vitiligo, bullous dissasses, graft versus host reactions, UV-induced skin inflammation and
                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  selected games (I) from within generasettes (GC) which comprises identifying DNA repeats that flank GC, hybridizing oligonucleotides (ON) to these repeats and amplification to produce DNA fragments containing (I), ligating these fragments into a vector and transforming cells with the vector. This method is used to clone a wide variety of prokaryotic genes that provide a selective advantage under particular conditions, particularly those that encode restriction enzymes (used as reagents in molecular biology); adhesins (for use in coating or for targeting molecular or organisms to particular sites, e.g. for competitive exclusion of a selected pathogen; detoxifying enzymes; toxins that interact with a host, e.g. for synthesis of inhibitors or antagonises of the toxin, or in vaccination, or a modification methyltransferase. This invention describes a novel method for cloning intact, diversity-
selected genes (1) from within gene cassettes (GC) which comprises
identifying DNA repeats that flank GC, hybridizing oligonucleotides (ON)
to these repeats and amplification to produce DNA fragments containing
to these repeats and amplification to produce DNA fragments containing
to the vector. This method is used to clone a wide variety of prokaryotic
genes that provide a selective advantage under particular conditions,
c particularly those that encode restriction enzymes (used as reagents in
molecular biology); adhesins (for use in coating or for targeting
c molecular biology); adhesins (for use in coating or for targeting
c molecular or organisms to particular sites, e.g. for competitive
interact with a host, e.g. for synthesis of inhibitors or antagonists of
the toxin, or in vaccination, or a modification methyltransferase. Inteat
genes can be cloned directly with a high probability that the orientation
of expression is known in advance and low probability of association with
extraneous, possibly toxic, agenes. This sequence represents a VCR element
core DNA sequence isolated from Vibrio cholera

selected genes (I) from within gene cassettes (GC) which comprises identifying DNA repeats that flank GC, hybridizing oligonuclectides (GN) to these repeats and amplification to produce DNA fragments containing to these repeats and amplification to produce DNA fragments containing (I), ligating these fragments into a vector and transforming cells with the vector. This method is used to clone a wide variety of prokaryotic genes that provide a selective advantage under particular conditions, particularly those that encode restriction enzymes (used as reagents in molecular biology); adhesins (for use in coating or for targeting molecules or organisms to particular sites, e.g. for competitive exclusion of a selected pathogen); detoxifying enzymes; toxins that interact with a host, e.g. for synthesis of finibitors or anagonists of the toxin, or in vaccination, or a modification methyltransferase. Intact genes can be cloned directly with a high probability of association with extransous, possibly toxic, genes. This sequence represents a vCR element very
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention describes a novel method for cloning intact, diversity-

A chemically synthesized promoter can comprise a conserved domain IIa as shown here for high level expression of genes. The sequence comprises a candem repeat of 2-8 nucleotides comprising A/G nucleotides. These claments are present beyond position -200 of the promoter. Chemically synthesized artificial promoters are new and comprise a DNA sequence constructed for a targeted level and pattern of gene expression by strategically putting together several signature sequences identified by sequence alignment and statistical analysis of a large database constructed for this purpose. A method for chemically synthesizing an artificial promoter for expression in a plant using such an artificial promoter (e.g. AAA28449) can be measured comprising such an artificial promoter (e.g. AAA28449) can be measured comprising such an artificial promoter (e.g. AAA28449) can be measured comprising such an artificial promoter (e.g. AAA28449) can be measured comprising such an artificial promoter leaf tissue followed by transient GUS assay to compare toot, stem, intact leaf tissue followed by transient GUS assay to compare the promoter is useful for high level sxpression of transgenes in chifferent craning and for testing high level sxpression in plants claimed). The promoter is biologically active and is efficient and can be synthesized to express in even the most complex organisms
                                                                                                                                                                                                                                                                                                                        New chemically synthesized artificial promoter, useful high level expression of transgenes in different organisms.

                                                                                                                                                                                                                The region immediately upstream of the sequence which codes for the human high affinity FC receptor for 1gG (the R gene) contains binding sites specific for haematopoietic cells, including the response element sequence AAQ63868. One or more copies of this sequence is preferred for conferring on a gene a transcriptional activity limited to haematopoietic cells. The DNA motif thus has potential in gene therapy. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The region immediately upstream of the sequence which codes for the human high affinity \Gamma receptor for 1gG (the R gene) contains binding sites specific for haematopoietic cells, including the response element sequence AAQ63868.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Integrating a DNA sequence into the genome of a vertebrate host cell, comprises introducing a construct comprising the DNA sequence and a recombination region homologous to a consensus defined flanking region of a short interspersed repeated DNA element (SINB), e.g. the present a short interspersed repeated DNA element (SINB), e.g. the present investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physiological indications and screen cosmetics, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In addition the method may enhance efficiency in gene therapy, when

```
Integrating a DNA sequence into the genome of a vertebrate host cell, comprises introducing a construct comprising the DNA sequence and a recombination region homologous to a consensus defined flanking region of a short interspersed repeated DNA element (SINE), e.g. the present sequence. The method may be used to modify the phenotype of cells, or investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting candogenous capabilities, investigate physical indications and screen inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In addition when method men enhances effective in a series of the particular transcriptional or translational product. In

The sequence is that of a cauliflower mosaic virus 35S enhancer sequence which can be used in a DNA construct which permits variation in enhancement of the transcription initiation rate in the plant cell. This allows the prodn. of new characteristics in transformed plants, e.g. increased prodn. of proteins for agronomical or commercial purposes when the construct contains a protein-coding sequence, or the regulation of exogenous gene expression by competing levels of antisense RNA. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligo-nucleotide(s) contg. transcription control recognition element - stabilised by covalent bonding of two DNA strands, act as decoys for regulatory protein to modulate specific RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Transcriptional control recognition element recognition sequences may be recognised by control proteins and are involved in either enhancing or repressing transcription of associated sequences. TCR sequences include promoter elements, hormone receptor elements, viral, cellular, liver or tissue elements, etc. The sequence represents an exemplary general element, the serum response element. A typical application of the TCRE recognising oligonucleotides is inhibition of viral proliferation. See also AAQ30472-518. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                which can be used in a DNA construct which permits variation in all an enhancement of the transcription initiation rate in the plant cell. This allows the prodn. of new characteristics in transformed plants, e.g. increased prodn. of proteins for agronomical or commercial purposes when the construct contains a protein-coding sequence, or the regulation of exogenous gene expression by competing levels of antisense RNA. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                          New plant cell comprising DNA contg. duplicated cauliflower mosaic virus 35 S enhancer sequence - used to provide enhanced transcription
                                                                                                                                                                                                                                                                                                                                                                                  sequence is that of a cauliflower mosaic virus 35S enhancer sequence

```
DNA construct for varying transcription initiation rate enhancement in plants - comprises transcription initiation region with tandem duplicated cauliflower mosaic virus 35-S enhancer sequence, nucleotide sequence, and termination region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence represents a single repeat unit of the CaMV 35S promoter. Synthetic enhancer domains comprises a plurality of the units of the natural enhancer spaced in the same was as in the natural enhancer. The synthetic enhancer doamins may be used in DNA constructs which allow for synthetic enhancer doamins may be used in DNA constructs which allow for increased rate of transcription. These constructs have wide application in the control of the formation of expression prods. and protection was against pathogens or antibiotics, etc. See also AAQ38816. (Updated on 25-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2; Length 10;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Transcriptional control recognition element recognition sequences may be recognised by control proteins and are involved in either enhancing or repressing transcription of associated sequences. TCR sequences include promoter elements, hormone receptor elements, viral, callular, liver or tissue elements, etc. The sequence represents an exemplary general element, the serum response element. A typical application of the TCRE recognising oligonucleotides is inhibition of viral proliferation. See also AAQ30472-518. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                     DNA construct for varying transcription initiation rate enhancement in plants - comprises transcription initiation region with tandem duplicated cauliflower mosaic virus 35-S enhancer sequence, nucleotide sequence, and
                                                                                                                                                                                      The sequence represents a single repeat unit of the CaWV 35S promoter. Synthetic enhancer domains comprise a plurality of the units of the natural enhancer. The natural enhancer. The synthetic enhancer spaced in the same was as in the natural enhancer. The increased rate of transcription. These constructs have wide application in the control of the formation of expression prods. and protection against pathogens or antibiotics, etc. See also AAQ38816. The sequence of a modified enhancer sequence used to construct a heterologous enhancer/promoter region for the improved expression of genes under control of the modified enhancer promoter in plants. The genes under control of the modified enhancer promoter in plants. The engineered enhancer region may contein portions of the sequence shown, at least the sequence of the cauliflower mosaic virus (CaMV15S) or a cherologous promoter of the cauliflower mosaic virus (CaMV15S) or a cherologous promoter preferably has an enhancer domain with one more repeat than the 15S enhancer. The natural enhancer sequence can be repeated several times in the enhancer region. The repeats can comprise of 4-16 bases, generally 4, 7, or 10 base repeate. The repeats structure may be imperfect, containing a core sequence surrounded by regions of foreign genes due to the presence of the engineered enhancer sequences. The improved contructions have wide applications e.g. in the control of the formation of products, protection against pathogens or antibiotics. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Enhancer element; repeat unit; promoter; cauliflower mosaic virus; CaMV35S; enhancer region; core sequence; variability; transgenic; plant; expression; foreign gene; pathogen; antibiotic; ss.

The sequence of a modified enhancer sequence used to construct a heterologous enhancer/promoter region for the improved expression of genes under control of the modified enhancer promoter in plants. The engineered enhancer region may contain portions of the sequence shown, at least the sequence GTGG or its complementary sequence. The promoter may the 1858 promoter of the cauliflower mosaic virus (CaMV35S) or a may electrologous promoter e.g. the T DNA gene 5 or 7 promoter. The engineered enhancer preferably has an enhancer domain with one more repeat than the 35S enhancer. The natural enhancer sequence can be repeated enhancer region. The repeats can comprise of 4-16 bases, generally 4, 7, or 10 base repeats. The repeat structure may be impereded, containing a core sequence surrounded by regions of variability. Transgenic plants show increased expression of foreign genes due to the presence of the engineered enhancer sequences. The improved contructions have wide applications e.g. in the control of the formation wab-3nn and a core sequence or antibiotics. (Updated on 25-
                                                                                                                                                                                                                                                                                                                                                                                                              ô

These units are repeated several times within the upstream sequence of the CaMV 35S promoter region. (Updated on 25-MAR-2003 to correct PF field.)

These units are repeated several times within the upstream sequence of the CaMV 35S promoter region. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Transcription initiation regions with enhanced transcription efficiency comprise tandemly duplicated CaMV 35S enhancer sequences and a promoter.

Integrating a DNA sequence into the genome of a vertebrate host cell, comprises introducing a construct comprising the DNA sequence and a recombination region homologous to ensemble defined flanking region of a short interspersed repeated DNA element (SINE), e.g. the present sequence. The method may be used to modify the phenotype of cells, or investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting animals, by providing novel capabilities to the cells or inhibiting condensured to sometics, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial addition the method may enhance efficiency in gene therapy, when
                                                                      Genomic integration of DNA by site directed recombination - using construct containing recombination region homologous to consensus defined flanking region of short interspersed repeated DNA element.
                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 10 BP; 3 A; 0 C; 0 G; 2 T; 0 U; 5 Other;

                                                                                                                                                                                                                                                                                                                            Integrating a DNA sequence into the genome of a vertebrate host cell, comprises introducing a construct comprising the DNA sequence and a secombination region homologous to a consensus defined flanking region of a short interspersed repeated DNA element (SINE), e.g. the present sequence. The method may be used to modify the phenotype of calls, or investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physiclogical indications and screen cosmetics, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In

This invention describes novel expression vector systems containing RNA stability elements from 3' flanking sequences used for establishing containity elements from 3' flanking sequences used for establishing CC expression of anucleic acid sequence within a tissue. The vectors also facilitate enhanced expression in tissues and target expression with ctissues and target expression with the expression vector to specific tissues.

CC tissue specificity. The expression vector to specific tissues.

CC through gene therapy by by targeting the vector to specific tissues.

CC tissue specificity. The expression vector to specific tissues.

CC through gene therapy by by targeting the vector to specific tissues to biseases trophic factors, haemophilia by causing tissues to express and secrete clotting factors, haemophilia by causing tissues to express and secrete clotting factors into the circulation, atherogenesis and atherosclerotic cardiovascular, cerebrovascular or peripheral-vascular atherosclerotic cardiovascular, cerebrovascular or peripheral-vascular contissues by causing the circulation, atherosclerotic cardiovascular, cerebrovascular or peripheral-vascular contissues to express factors involved in tissue contissues by causing the contisted genetic defects or acquired hormone deficiencies e.g. diabetes. To transform cells to produce particular proteins or RNA in vitro. To create transform cells to produce particular proteins or RNA in vitro. To create transform cells to produce particular proteins or RNA in vitro. To create transform cells to produce particular proteins or RNA in vitro. To create transform cells to produce particular proteins or RNA in vitro. To create transform cells to produce and sensiting the effect of chemical and genetic physical carcinogens and for studying the effect of chemical and genetic
                                                                                                                                                                                                                             ö
inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In addition the method may enhance efficiency in gene therapy, when providing for a capability in which the host is deficient

the

physical carcinogens and for studying the effect of genes and genetic regulatory elements or livestock improvement. They can be used to induce an immune response. These vectors provide controlled expression of the genes they carry and produce a significantly high level of expression. Using 3.0TR sequences reduces the decay rates of the mRNAs encoded by the vectors which causes increased expression

```
This invention describes novel expression vector systems containing RNA stability elements from 3' flanking sequences used for establishing expression of anceleic acid sequence within a tissue. The vectors also facilitate enhanced expression in tissues and target expression with tissues specificity. The expression vectors can be used to treat diseases through gene therapy by targeting the vector to specific tissues.

Chrough gene therapy by targeting the vector to specific tissues.

Diseases that can be treated include muscle atrophy associated with neurological, muscular or systemic disease, aging by causing tissues to express and secrete clotting factor into the circulation, atherogenesis and steroselerotic cardiovascular, cerebrovascular or peripheral-vascular diseases by causing tissues to express factors involved in tissue metabolism. They can be used to replace genes of inherited genetic defects or acquired hormone deficiencies e.g. diabetes. To transform cells to produce particular proceins or RNA in vitro. To create cells to produce particular proceins or RNA in vitro, human diseases, cells to produce particular proceins or RNA in vitro, tho man disease, assessing novel therapeutic metabols, assessing the effect of chemical and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates the diagnosis of genetic susceptibility for end-stage renal disease (ESRD). The method involves analysing a polynucleotide sample for a single nucleotide polymorphism (SNP) associated with an altered susceptibility for ESRD. The method allows early detection of ESRD and hence effective delay or ideally, prevention of ESRD and hence effective delay or ideally, prevention human TGFD-RII promoter sequence (see AAA91867). Polymorphisms in this gene are known to be a probable trigger for renal apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Diagnosing genetic susceptibility for end-stage renal disease using single nucleotide polymorphisms, involves analyzing sample obtained from subject to detect genetic polymorphism in the sample polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                Complement of SNP site beginning at position 546 of the TGFb-RII gene.
                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates the diagnosis of genetic susceptibility for and-stage renal disease (ESRD). The method involves analysing a polynucleotide sample for a single nucleotide polynorphism (SND) associated with an altered susceptibility for ESRD. The method allows early detection of ESRD and hence effective delay or ideally, prevention of ESRD is made possible. The present sequence is a SND site found in the human TGRD-RII promoter sequence (see AAA91867). Polymorphisms in this gene are known to be a probable trigger for renal apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Diagnosing genetic susceptibility for end-stage renal disease using single nucleotide polymorphisms, involves analyzing sample obtained from subject to detect genetic polymorphism in the sample polynucleotide.
                                                                                                                                                   Complement of SNP site beginning at position 546 of the TGFb-RII gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention describes a method of screening for preneoplastic/neoplastic disease. The method comprises: (1) determining whether abnormal NM gene expression is present in a vertebrate; and (2) if abnormal NM gene expression is present in the vertebrate abnormal NM gene expression is determined to be present in the carbonate, determining that the vertebrate has a significant risk of vertebrate, determining that the vertebrate has a significant risk of carbonate and preneoplastic/deoplastic disease. The NM gene is an oncogene and canceds an NM protein (also referred to as NM/CA IX isoenzyme). The MN cc protein is a tumour associated carbonic anhydrase isoenzyme. The method cc is used for detecting a wide variety of preneoplastic/neoplastic diseases in a vertebrate, preferably a human. The disease detected is mammary, bladder, renal, urinary tract, ovarian, uterine, cervical, endometrial, certicular, brain, head and neck, mesodermal, gallbladder, rectal, concentic duct epithelium, small intestinal mucosa, gallbladder aptthelium, small intestinal mucosa, colorectal concess, pancreatic duct epithelium or liver duct epithelium cc preneoplastic/neoplastic disease. AAA16540 to AAA16517 and AAX53228 to increase.

The present invention describes a method of screening for preneoplastic disease. The method comprises: (1) determining whether abnormal NM gene expression is present in a vertebrate; and (2) if abnormal NM gene expression is determined to be present in the vertebrate, determining that the vertebrate has a significant risk of vertebrate, determining that the vertebrate has a significant risk of thaving preneoplastic/fneoplastic disease. The NM gene is an oncogene and encodes an NM protein (also referred to as NM/CA IX isoenzyme). The NM protein is a tumour associated carbonic anhydrase isoenzyme. The method is used for detecting a wide variety of preneoplastic/fneoplastic diseases in a vertebrate, preferably a human. The disease detected is manmary, bladder, renal, urinary tract, ovarian, uterine, cervical, endometrial, cesticular, brain, head and neck, mesodermal, gallbladder, rectal, duodenal, jejunal, ileal, gastric, pancreatic duct, liver duct, gastric mucosa, gallbladder epithelium or liver duct epithelium consa, pancreatic duct epithelium or liver duct epithelium pancreatic duct epithelium or liver duct epithelium pancreatic duct epithelium or liver duct epithelium consa, pancreatic duct epithelium or liver duct epithelium pancreatic duct epithelium or liver duct epithelium pancreatic duct epithelium or liver duct epithelium consa, pancreatic duct epithelium encompancreatic duct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid based assay for diagnosing a wide variety of preneoplastic/neoplastic disease comprises screening for the presence of abnormal MN gene expression in a vertebrate.
                                                                                                          Human; MN protein; MN gene; oncogene; carbonic anhydrase; tumour; oncogenesis; diagnosis; neoplastic disease; cancer; carcinoma; MN/CA IX isoenzyme; PCR primer; ss.

The invention relates to the inhibition of cell adhesion mediated by the MN oncoprotein (also known as the MN/CA IX isoenzyme or the MN/G250 protein). The MN protein is a tumour-associated adhesion molecule which comprises a proteoglycan-like (PG) domain (AAB03017) which contains the protein's binding site, and a carbonic anhydrase (CA) domain (AAB03018). The invention encompasses molecules (e.g., proteins and peptides) which which specifically bind to a site on the MN protein, thereby preventing adhesion of vertebrate cells to the protein in a cell adhesion assay. It also encompasses MN proteins of the AMN protein fragments which can be added to the extracellular environment to prevent the adhesion of vertebrate cells to the ach other. The invention also relates to the identification of the binding site of the MN protein and to a method of identifying a site on an MN protein to which cells adhere, comprising testing a series of coverlapping peptides from the protein in a cell adhesion assay. The invention encompasses a vector comprising an expression control sequence operatively linked to a nucleic acid encoding the variable domains of the NN specific antibody, where the domains are separated by a flexible of invention also encompasses a vector comprising an expresses MN vertebrate preneoplastic cell that abnormally expresses MN vertebrate preneoplastic cell that abnormally expresses MN vertebrate preneoplastic cell that abnormally expresses MN vertebrate preneoplastic encompasses a vector compasses and the vector compasses and th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          acid encoding a cytotoxic protein or peptide operatively linked to the MN gene promoter, which inhibits the growth of a vertebrate preneoplastic or neoplastic cell. Also claimed is a repressor complex that binds to the MN gene promoter (AAA52473). MN proteins and peptides, MN-binding proteins and peptides, and expression vectors encoding such proteins and peptides are useful for treating patients with preneoplastic or neoplastic disease (e.g., cancers) associated with or characterised by abnormal MN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          expression. The present sequence represents a consensus initiator (Inr)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; Page 27; 154pp; English

The invention relates to the inhibition of cell adhesion mediated by the MY oncoprotein (also known as the MY/CA IX isoenzyme or the MW/C250 protein). The MW protein is a tumour-associated adhesion molecule which comparises a proteoglycan-like (FG) domain (AAB03017) which contains the protein's binding site, and a carbonic anhydrase (CA) domain (AAB03018). Abnormal expression of the MW protein is associated with tumorigenicity. The invention encompasses molecules (e.g., proteins and peptides) which specifically bind to a site on the MW protein and peptides) which specifically bind to a site on the MW protein fragments which can be addeed to the extracellular environment to prevent the adhesion of vertebrate cells to the protein fragments which can be addeed to the extracellular environment to prevent the adhesion of vertebrate cells to each other. The invention also relates to the identification of the binding site of the MW protein and to a method of identifying a site of the binding site of the MW protein and to a method of identifying a site of an MW protein to which cells adhere, comprising a series of coverlapping peptides from the protein in a cell adhesion assay. The operatively linked to a nucleic acid encoding the variable domains of a correbrate preneOplastic call that abnormally expresses MW especific antibody, where the domains are separated by a flexible clinker peptide (AAB03035) and the vector inhibits the growth of a vertebrate preneOplastic call that abnormally expresses MW carebrate preneOplastic call that abnormally expresses MW proteins and peptides and expression vectoris encoding such proteins and peptides and expression vectors encoding such proteins and peptides are useful for treating patients with preneOplastic or neoplastic cell that benomental MW proteins and peptides (e.g., cancers) associated with or characterised by abnormal MW
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A molecule which specifically binds to a site on MN protein (oncoprotein) and prevents adhesion of vertebrate cells to the protein, useful for treating preneoplastic or neoplastic diseases such as cancer.
                                                                                                                                                                                                                                                                                                                      MN protein; tumour associated cell adhesion molecule; oncoprotein; proteoglycan domain; PG domain; carbonic anhydrase; CA domain; abnormal expression; neoplastic disease; cancer; gene therapy; promoter; consensus initiator element; Inr; ds.
                                                                                                                                                                                                                                                                         Initiator (Inr) element consensus sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pastorek J;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Page 27; 154pp; English.

The motif is present in almosth muscle elements 1 and 4 of the mouse smooth muscle 22 alpha (SM22-alpha) gene promoter (see AAH26682). CArG boxes are involved in the binding of the MADS box transcription factor SRF, and may play an important role in regulating the transcription of genes encoding skeletal and cardiac alpha-actin. The invention provides methods of preventing restenosis following balloon angioplasty and methods of treating asthma. The methods are based on inhibition of smooth muscle proliferation by expressing cell cycle control genes or contraction inhibition peptides in smooth muscle cells, under the control of the SM22-alpha gene promoter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ó

Expressing a polypeptide other than a mouse SM22alpha in a cell, useful in treating restenosis, by providing to the cell a nucleic acid construct comprising an SM22alpha promoter operably linked to the sequence encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for expressing a polypeptide other than a mouse SM22alpha in a cell comprising providing to the cell a nucleic acid construct having an SM22alpha promoter operably linked to a nucleotide sequence encoding the polypeptide. The method is useful for preventing restenosis following balloon angioplasty and treating asthma based on inhibition of smooth muscle cell proliferation by expressing cell cycle control genes. The present sequence is a consensus CArG box embedded in a smooth muscle element (SME)
Murine, SM22alpha, therapy, restenosis, balloon angioplasty; asthma, smooth muscle cell; proliferation; vasotropic, smooth muscle element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Murine, SM22alpha, therapy, restenosis, balloon angioplasty, asthma, smooth muscle cell; proliferation, vasotropic, smooth muscle element.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of a CArG box motif. The motif is present in smooth muscle elements 1 and 4 of the mouse smooth muscle 22 alpha (SM22-alpha) gene promoter (see AAH26682). CArG boxes are involved in the binding of the MAD box transcription factors SRF, and may play an important role in regulating the transcription of genes encoding skeletal and cardiac alpha-actin. The invention provides methods of preventing restenosis following balloon angioplasty and methods of treating asthma. The methods are based on inhibition of smooth muscle proliferation betwiese smooth muscle cells, under the control of the SM22-alpha gene promoter
                                                                                                                                                                                                                       CArG box; smooth muscle 22 alpha; SM22-alpha; promoter; mouse; restenosis; atherosclerosis; asthma; cell proliferation; antiasthmatic; antiarteriosclerotic; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modulating smooth muscle cell proliferation in a mammal, useful for treating or preventing proliferation diseases, e.g. atherosclerosis, restenosis or asthma, comprises contacting cells with smooth muscle 22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                            셤
                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                         Expressing a polypeptide other than a mouse SM22alpha in a cell, useful in treating restenosis, by providing to the cell a nucleic acid construct comprising an SM22alpha promoter operably linked to the sequence encoding
                                                                                                                                                                                              The present invention relates to a method for expressing a polypeptide other than a mouse SM22alpha in a cell comprising providing to the cell a nucleic acid construct having an SM22alpha promoter operably linked to a nucleotide sequence encoding the polypeptide. The method is useful for preventing restenosis following balloon angioplasty and treating asthma based on inhibitron of smooth muscle cell proliferation by expressing cell cycle control genes. The present sequence is a consensus CARG box embedded in a smooth muscle element (SME)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Promoting angiogenesis and preventing atherosclerosis or restenosis following balloon angioplasty, comprises providing to smooth muscle cell nucleic acid construct containing an SM22 alpha promoter.
                                                                                                                                                                                                                                                                                                                                                                              Gaps

The patent discloses a method for promoting angiogenesis in a mammal by providing a nucleic acid construct comprising an SM22 alpha promoter to a smooth muscle cell (SMC) in the mammal. The promoter is operably linked to a nucleotide sequence encoding a polypeptide or RNA competent to induce angiogenesis. The method is useful for promoting angiogenesis, for preventing atherosclerosis, restenosis or other arterial injury following balloon angioplasty and airway blockage in astham. The promoter may be used to express heterologous proteins or mRNAs in proliferating smooth angiogenesis. The present sequence is a consensus CARG box embedded in nuclear protein binding sites, designated as smooth muscle element (SME). This sequence binds to the MADS box transcription factor, SRF and play an inequilating the transcription of genes encoding skeletal
                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The patent discloses a method for promoting angiogenesis in a mammal by providing a nucleic acid construct comprising an SM22 alpha promoter to a smooth muscle cell (SMC) in the mammal. The promoter is operably linked to a nucleotide sequence encoding a polypeptide or RNA competent to induce angiogenesis. The method is useful for promoting angiogenesis, for preventing therecolectis, restenosis, or other arterial injury following balloon angioplasty and airway blockage in asthma. The promoter may be used to express heterologous proteins or mRNAs in proliferating smooth muscle cells and to control proliferative diseases, or to promote

ó
angiogenesis. The present sequence is a consensus CArG box embedded in nuclear protein binding sites, designated as smooth muscle element (SME). This sequence binds to the MADS box transcription factor, SRF and play an important role in regulating the transcription of genes encoding skeletal and cardiac alpha actin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cloning Thermus species (Ts) plasmid genes comprises transforming Sechericitia coli with cloned recombinant plasmid containing Ts and B.coli origins of replication, isolating cloned recombinant plasmid from B.coli and transforming Ts cell.

The present DNA sequence is Thermus 9kb Sph1 fragment consensus direct repeat I of pTsp45L plasmid. This 9kb Sph1 fragment encodes a partition protein, pars gene. The direct repeat is important for pTsp45L plasmid replication. The invention relates to Thermus sp. replication protein ParA and their corresponding DNA molecules which relates to recombinant DNA molecules encoding plasmid DNA replication origins in Thermus, as well as to shuttle vectors which contain the same. The invention also relates to method useful for cloning Thermus sp. plasmid genes which comprises inserting plasmid DNA comprising a Thermus sp. origin of replication (Ori) into a recombinant plasmid conprising a thermostable kanamycin-resistance gene and an Escherichia coli Ori, to produce a cloned recombinant plasmid is transformed with an B. coli. host cell, nost cell cultured for the expression of cloned recombinant plasmid isolated from B. coll host cell is then transformed with Thermus sp. host cell and Thermus sp. host cell is cultured. Thus Thermus sp.

The present DNA sequence is Thermus 9kb SphI fragment consensus direct repeat I of pTsp45L plasmid. This 9kb SphI fragment encodes a partition protein, part agene. The direct repeat is important for pTsp45L plasmid replication. The invention relates to Thermus sp. replication protein ParA and their corresponding DNA molecules which relates to recombinant DNA molecules accoding plasmid DNA molecules which contain the same. The invention also relates to method useful for cloning Thermus sp. The invention also relates to method useful for cloning Thermus sp. plasmid genes which comprised method useful for cloning Thermus sp. plasmid genes which comprised method useful for cloning Thermus sp. origin of replication (Ori) into a recombinant plasmid comprising a thermostable kanamycin-resistance gene and an Escherichia coli Ori, to produce a cloned recombinant plasmid. This cloned recombinant plasmid is transformed with an E. coli host cell, and E. coli. host cell cultured for the expression of cloned recombinant plasmid. The cloned recombinant plasmid isolated from E. coli host cell is then transformed with Thermus sp. plasmid genes are cloned. These plasmid DNAs are used for thermophilic transformation

                                                                                                                                                              Mammalia.
RESULT 125
```

The invention relates to a bioprosthesis comprises a smooth muscle cell transfected with a nucleic acid segment comprising an SM22alpha promoter cregion operably linked to a DNA sequence encoding a molecule other than mouse SM22alpha (a smooth muscle specific protein). Also included are a method of providing a molecule of interest to a providing a bioproschesis comprising in a blood vessel in a mammal obtaining expression and a method of providing a molecule of interest to a blood vessel in a mammal by providing a bioproschesis comprising an obtaining expression and a method of providing a molecule of interest to a blood vessel in a mammal by providing a bioproschesis comprising an obtaining expression and a method of providing a molecule of interest to algomer comprising and ABX3335, and sequence that hybridizes with the complement of the above sequences, placing in a blood vessel and obtaining expression. The bioproschesis can be used in methods to provide therapy). It can also be used in the prevention of restenosis following consideration of aschma and putch other smooth muscle cell proliferative confidence is constitutive and cell cycle independent, it thus promotes to promoter is constitutive and cell proliferating cells in contrast to cher xerent implants and in the treatment or contrast to cher xerent implants and in the treatment of the spromotes contrast to contract the proposed in bother smooth muscle cell specific promoter is constitutive and cell proliferating cells in contrast to cher xerent sequence is a transcription factor of proliferating cells. The present sequence is a transcription factor.

The invention relates to a bioprosthesis comprises a smooth muscle cell transfected with a nucleic acid segment comprising an SM22alpha promoter cregion operably linked to a DNA sequence encoding a molecule other than mouse SM22alpha (a smooth muscle specific protein). Also included are a molecule of providing a molecule of interest to a blood vessel in a mammal by providing a molecule of interest to obtaining expression and a method of providing a molecule of interest to a blood vessel in a mammal by providing a bioprosthesis comprising an ablood vessel and coligomer comprising SME1 - SME6, corresponding to the EMS3 (cletrophorette mobility shift assay) appearing as ABK3341, ABK33343, CRS3345, ABK33345, ABK333545, ABK33345, ABK333545, ABK33345, ABK33345,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to the use of all or part of a NET (also known as ERP or SAP-1) polypeptide to identify compounds modulating angiogenesis or compounds that can be used to prevent or treat pathologies associated with angiogenic disorders. The invention also comprises transgenic animals that bear mutations in the NET gene. The method and transgenic animals of the invention are useful to identify compounds to treat pathologies associated with angiogenic disorders involving insufficient vascularisation and requiring inocrassed angiogenesis (e.g. cardiac/peripheral ischaemia, defects in wound healing and vascular restenosis, peripheral ischaemia, defects in wound healing and vascular restenosis, hypertension, ulcers, alzheimer's disease, lymphocedema, demential or involving increased vascularisation and requiring decreased angiogenesis (e.g. atherosclerosis, haemangioma, haemangioendothelioma, ovarian hyperstimulation, endometriosis, ascites, follicular cysts, ). They are also useful to identify compounds useful to treat pathologies associated with angiogenic disorders such as Kaposi sarcoma, tumour growth and cancer, or other pathologies in which NET is activated). Such compounds

may also be used to treat allergies, dysfunctional uterine bleeding, respiratory distress, rheumatoid arthritis, bone and cartilage dysfunction, obesity, synovitis, inflammation, hepatitis, such sethnospathy, thyroiditis, pneumonia, nasal polyps and thyroiditis. Such compounds may be e.g. antisense polyps and thyroiditis. Such compounds may be e.g. antisense intracellular binding proteins or blocking expression of a NET gene, intracellular binding proteins or NET dominant negative mutants. Compounds modulating NET activity may also be included in medicaments to prevent and/or treat pathologies associated with angiogenic disorders. The present sequence represents a serum responsive element (SRE)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NET; 88; ERP; SAP-1; angiogenesis; transgenic; ulcer; SRE; gel-shift; ischaemia; wound healing; vascular restenosis; hypertension; dementia; alzheimer's disease; lymphoedema; atheroosle; haemangioma; bone; haemangioendothelioma; ovarian hyperstimulation; endometriosis; ascites; follicular cyst; Kaposi sarcoma; tumour; cancer; allergy; synovitis; respiratory distress; rheumatoid arthritis; pneumonia; thyroditis; cartilage dysfunction; obseity; asthma; inflammation; hepatitis; glomerulonephritis; diabetic retinopathy; thyroditis; nasal polyp;

pathologies associated with angiogenic disorders involving insufficient vascularisation and requiring increased angiogenesis (e.g. cardiac/ peripheral ischemia, defects in wound healing and vascular restenosis, hperheral ischemia, defects in wound healing and vascular restenosis, hpertension, ulcers, alzheimer's disease, lymphocedema, dementia) or involving increased vascularisation and requiring decreased angiogenesis (e.g. atherocaelerosis, haemangioma, haemangicendethelioma, ovarian hyperstimulation, endometriosis, ascites, follicular cysts, ). They are also useful to identify compounds useful to treat pathologies associated with angiogenic disorders such as Kaposi sarcoma, tumour growth and cancer, or other pathologies in which NET is activated). Such compounds may also be used to treat allergies, dysfunctional uterine bleeding, respiratory distress, rheumatcoid arthritis, bone and cartilage respiratory distress, rheumatcoid arthritis, bone and cartilage glomerulonephritis, asthma, retinopathy, thyroiditis, purchasin of a holymucleotides downregulating or blocking expression of a NET gene, intracellular binding proteins or NET dominant negative mutants.

Compounds modularing NET activity may also be included in medicaments to prevent and/or treat pathologies associated with angiogenic disorders.

The present sequence represents a serum responsive element (SRE)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of an example of a CpG motif. The invention relates to methods for the prevention or treatment of autoimmune disease, particularly insulin dependent diabetes mellitus (IDDM). A DNA vaccine which includes a CpG motif, such as that given in the CpG oligonucleotide of ABL53541, is preferably used. The vaccine may also include DNA encoding an antigen associated with the autoimmune disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CpG; autoimmune disease; insulin dependent diabetes mellitus; IDDM;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of an example of a CpG motif. The invention relates to methods for the prevention or treatment of autoimmune disease, particularly inbulin dependent diabetes mellitus (IDDM). A DNA vaccine which includes a CpG motif, such as that given in the CpG oligonucleotide of ABL53541, is preferably used. The vaccine may also include DNA encoding an antigen associated with the autoimmune disease

Arabidopsis thaliana.

WO200222675-A2

21-MAR-2002.

Pathogen infection-related gene consensus motif 1 cis element #710.

22-APR-2004 (first entry)

ADG88268;

```
The invention relates to 691 Arabidopsis thaliana genes (ADG87559--
ADG87557)) whose expression is altered in response to pathogen infection,
and to homologues of these genes from other plants or fungi, especially
from maize, soybean, barley, alfalfa, sunflower, canola (oilseed rape),
cotton, peanut, sorghum, tobacco, sugarbeet, rice or wheat. The
expression of genes of the invention was upregulated or downregulated in
Arabidopsis plants infected with the comyctee Peronospora parasitica,
indicating that they play a role in defence mechanisms. The genes of the
invention are regulated by RPPF or RRPB which act via unconventional
cationalism cascades, or by the RPPF dependent pathway. The invention also
relates to polypeptides encoded by the pathogen infection-related genes (ADG88243-ADG88327)
crelates to polypeptides encoded by the pathogen infection related genes;
collates motifie from pathogen infection related genes (ADG88243-ADG88327)
conference motifie from pathogen infection and pathogen. Testistant transgenic
plants and their progeny comprising a polynucleotide of the invention,
collater motified sequences and methods of the invention are useful for
identifying plants infected with a pathogen, and for conferring
consensus sequence for cis elements from the promoters of Arabidopsis
consensus sequence for cis elements from the promoters of Arabidopsis
consensus sequence for cis elements from the promoters of Arabidopsis
consensus sequence for cis elements from the promoters of Arabidopsis
consensus infection. Note: The sequence data for this patent can also be
obtained in electronic format directly from WIPO at
consensus and places and place and

```
The invention relates to 691 Arabidopsis thaliana genes (ADG87559--
ADG87557}) whose expression is altered in response to pathogen infection,
and to homologues of these genes from other plants or fungi, especially
from maize, soybean, barley, alfalfa, sunflower, canola (oilseed rape),
cotton, peanut, sorghum, tobacco, sugarbeet, rice or wheat. The
expression of genes of the invention was upregulated or downregulated in
Arabidopsis plants infected with the comycete Peronospora parasitica,
indicating that they play a role in defence mechanisms. The genes of the
invention are regulated by RPP7 or RRP8 which act via unconventional also
consistent on polypeptides encoded by the pathogen infection-related genes;
promoter motifs from pathogen infection-related genes (ADG88137)
c expression cassettes, host cells and pathogen resistant transgenic
plants and their progeny comprising a polymucleotide of the invention
c plants and their progeny comprising a polymucleotide of the invention
c plants encomes and methods of the invention are useful for
identifying plants infected with a pathogen, and for conferring
resistance to pathogens such as oomycetes, fungi, bacteria, viruses,
consensus sequence for cis elements from the promoters of Arabidopsis
consensus sequence for cis elements from the promoters of Arabidopsis
consensus sequence for cis elements from the promoters of Arabidopsis
consistica infection. Note: The sequence data for this patent can also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                     vaccine
        The present sequence is that of a thiosubstituted oligodeoxymucleic acid molecule, ODN 16-A, including a deoxyuridine monophosphate. The invention oblas based on the discovery that ODNs containing deoxyuridine residues (U-DDNs) have an immunostimulatory effect comparable to, or in many finatances greater than, ODNs containing CpG motifs, producing higher the systemic production of pro-inflammatory cytokines and, induce the systemic production of pro-inflammatory cytokines and, in contrast to Sequence. Use of a U-DDN for the preparation of a vaccine is claimed. Combining the U-DDN with an antigen extrangly increases the potential of the antigen to raise the protection/immune response of a vaccinated individual. An example of the invention demonstrated the generation of a specific immune response against a malanoma-derived peptide (see SESSESSES) by injection of mice with the peptide in combination with ODN

The present sequence is that of a thiosubstituted oligodeoxynucleic acid molecule, ODN 16-A, including a deoxyuridine monophosphate. The invention is based on the discovery that ODNs containing deoxyuridine residues (U-DNs) have an immunostimulatory effect comparable to, or in many containes greater than, ODNs containing CpG motifs, producing higher numbers of specific T cells to a given artigen. The U-ODNs do not induce the systemic production of pro-inflammatory cytokines and, in contrast to CpG ODNs, are not dependent on a specific motif or a palindromic sequence. Use of a U-ODN for the preparation of a vaccine is claimed. Combining the U-ODN with an antigen strongly increases the potential of the antigen to raise the protection/immune response of a vaccinated individual. An example of the invention demonstrated the generation of specific immune response against a melanoma-derived peptide (see Specific immune response against a melanoma-derived peptide (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
